Environmental Hazard Monitoring Solutions for Homes

Theft and fire are just a couple things that can damage your home. Water pipe bursts and flooding can destroy your property and your belongings. Meanwhile, high carbon monoxide levels can create health and safety hazards.

That's why Vector Security® provides environmental hazard monitoring solutions to protect you and your home:

- **Low temperature sensors** can be installed in basements, bathrooms, kitchens and other areas of your home where water pipes are present. They let you – and our Monitoring Center operators – know when the temperature in these areas drops below 45 degrees so action can be taken to prevent or limit damage.
- **Water leak sensors** installed in flood-prone areas of your home detect accumulation of water caused by cracked or broken water pipes, loose pipe connections, inadequate drainage or flooding. If excessive water levels are detected, an alarm is triggered to notify you, while a signal is sent to our Monitoring Center so action can be taken right away.
- **Carbon monoxide detectors** placed throughout your home warn of toxic carbon monoxide levels so you can quickly evacuate to prevent sickness and health risks. Our service includes replacement every five years so you can be certain you're always protected.
